

Maria Luisa Fiani is senior researcher at Istituto Superiore di Sanità. Her research interests have been focused for many years on the mechanisms of endocytosis and intracellular trafficking mediated by the mannose receptor, spending long periods in the US as post doctoral fellow. Currently she is focused in the study of exosomes biogenesis by using an innovative methodology developed in the lab to fluorescently label the lipid bilayer of exosomes and in the mechanisms of cell-to-cell transmission of signals mediated by exosomes.
